T. Cloning of the rat edg-1 immediate-early gene: expression pattern suggests diverse functions.";

Gene 149:311-336(1994).

-I. FUNCTION: Receptor for the lysosphingolipid sphingosine 1-phosphate (SIP). SIP is a bioactive lysophospholipid that elicits diverse physiological effect on most types of cells and tissues.

This inducible epithelial cell G-protein-coupled receptor may be involved in the processes that regulate the differentiation of endothalial cells. Seems to be coupled to the G(i) subclass of heteromeric G proteins (By similarity).

-I. SUBCELLULAR LOCATION: Integral membrane protein.

-I. DEVELOPMENTAL STAGE: First detected at embryonic day 15. At postnatal day 14 detected in skin, spleen, liver, kidney, heart, testicle, lung and brain. At adulthood is most abundant in brain.

-I. SIMILARITY: Belongs to the G-protein coupled receptor 1 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-JUN-2001 (TrEMBLrel. 17, Created)
01-JUN-2001 (TrEMBLrel. 17, Last sequence update)
10-MAY-2005 (TrEMBLrel. 30, Last annotation update)
Mus musculus adult male lung cDNA, RIKEN full-length enriched library, clone:1200004B16 product:endothelial differentiation sphingolipid G-protein-coupled receptor 1, full insert sequence (Endothelial differentiation sphingolipid G-protein-coupled receptor 1).
Name=Edg1;
Mus musculus (Mouse).
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Butheria; Euarchontoglires; Glires; Rodentia; Sciurognathi;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3 SLYSEYLNPNKVQEHYNYT-KETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVARN

Submitted (MAR-2005) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
-!- SIMILARITY: Belongs to the G-protein coupled receptor 1 family.

New isolated lysolipid/EDG receptor useful in the treatment of asthma and rheumatoid arthritis.

Claim 7; Fig 16B; 120pp; English.

A novel isolated lysolipid (LL) receptor/EDG receptor (EDG-4). The LL/EDG receptors are involved in an inflammatory response signaling pathway and an apoptetic signaling pathway. They can be used for identifying sgonists or antagonists of NF-kB or IL-8 modulated EDG or LL receptors. Agonists can be used for upregulation of an inflammatory process condition or immune response. Antagonists can be used for the downregulation of an inflammatory process condition or immune response. The agonists and antagonists can also be used for controlling apoptosis in a cell comprising the LL/EDG receptor. A diagnostic test for aberrant expression of HEDG-4 can accelerate diagnosis and proper treatment of abnormal conditions of e.g. the heart, kidney, lung and testis. Specific examples

The present sequence is a human EDG family protein designated H218. H218 is used for diagnosing disease or its susceptibility in a subject related vis used for diagnosing disease or its susceptibility in a subject related with expression or activity of H218 by determining the presence or absence of mutation in the polymucleotide encoding H218 in the genome of the subject and/or analysing for the presence of H218 expression in carrier and derived from the subject. It is also used for treating subjects in need of enhanced activity or inhibition of H218 by administering an agonist or antagonist respectively. H218 can be used to treat abnormal conditions such as bacterial, fungal and viral infecting, particularly H1V-1 or 2, cancers, diabetes, obesity, anorexia, bulimia, asthma, conditions active have teather and absence acute heart failure, hypotension, hypertension, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, atroach, ulcers, asthma, allergies, benign prostatic hypertrophy, angraine, vomiting, psychotic, neurological disorders and dyskinesias can be treated. The H218 polynucleotide can also used for obtaining concluing H218. The difference in collating full-length clones encoding H218. The difference in collating full-length clones consuming the disease. It is also valuable for hormosome identification. The polypeptide is used for the identification of membrane bound or collars tructure based design of agonist, antagonist or inhibitor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

A apoptotic signaling pathway. They can be used for identifying pathway and an apoptotic signaling pathway. They can be used for identifying agonists or an apoptotic signaling pathway. They can be used for identifying agonists can be used for upregulation of an inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and inflammatory process condition or immune response. The agonists and antagonists can also be used for controlling apoptosis in a cell comprising the LL/EDG receptor. A diagnostic test for aberrant expression of HEDG-4 can accelerate diagnosis and proper treatment of abnormal conditions of e.g. the heart, kidney, lung and testis. Specific examples of conditions in which aberrant expression of HEDG-4 may play a role include adult respiratory distress, asthma, rheumatorial arthritis, stroke, neurotrauma, Alzheimer's disease, asthma, rheumatorial arthritis, stroke, neurotrauma, Alzheimer's disease, asthma, rheumatorials, stroke, cardiac ischemia, acute pancreatitis, septic shock, psoriasis, stroke, liver, and early diabetic glomerulopathy, as well as lung damage to be used as the continuation of an indiplodies, inhibitors, ligands or their analogs can be used as the continuation of an indiplodies, inhibitors, ligands or their analogs can be used as the continuation of an indiplodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated lysolipid/EDG receptor useful in the treatment of asthma and

```

The present sequence represents an Edg polypeptide. The specification describes Edg4 and Edg5 polypeptides. The Edg4 gene is located on chromosome 19p12. The Edg polypeptides are receptors for 19p3 and sphingolipids, such as lysophosphatidic acid (LPA) and sphingosine 1-phosphate (S1P). The Edg receptor proteins are used for diagnosing an LPA or S1P mediator condition an individual. Edg4 and Edg5 polypeptides can be used in screening assays designed to determine the effects of a candidate bloactive agent on the expression and activity of Edg4 and Edg5 polypeptides, and the function of LPA and S1P. Nucleided sequences encoding Edg-4 and Edg-5 are useful as hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. Nucleic acide which encode Edg4 or Edg5 or their medified forms can also be used to generate either transgenic animals or knock out animals. 240 VFIVCWLPAFSILLLDYACPVHSCPILYKAHYLFAVSTLNSLLNPVIYTWRSRDLRREVL 300 241 VFIVCWLPAFSILLLDYACPVHSCPLLYKAHYXFAVSTLNSLLNPVIYTWRSRDLRREVL 300 Novel human polypeptide receptors for lysophospholipids and sphingolipids, native human Edg4, Edg5, mutant of Edg4 comprising extended polypeptide tail, used to screen agents that affect LPA and S1P 181 TVLPLYAKHYVLCVVTIFSIILLAIVALYVRIYCVVRSSHADWAAPQTLALLKTVTIVLG FSLLAIAIERHVAIAKVKLYGSDKSCRMLLLIGASWLISLVLGGLPILGWNCLGHLEACS TVLPLYAKHYVLCVVTIFSIILLAVVALYVRIYCVVRSSHADMAAPQTLALLKTVTIVLG RPLQCWRPGVGVGVGRRRGGTPGHHLLPLRSSSSLERGWHMPTSPTFLEGNTVV 353 Edg4, Edg5, lysophospholipid receptor, sphingolipid receptor, S1P, lysophosphatidic acid, LPA: sphingosine 1-phosphate, gene therapy.                                                                                                                                                                                                                                 The present invention relates to methods for screening for preventives or remedies for proliferative glomerular nephritis, depending on the inhibitory effect on Endothelial Differentiation Gene, Edg-5, activation. The method is especially useful for screening preventives or remedies for Igh nephritis. The present sequence is human Edg-5, which was used in the method of the invention

(RIGE-) RIGEL PHARM INC.

Identifying lymphocyte modulator activation/migration, by contacting an BDG G-protein coupled receptor polypeptide or cell having the polypeptide with compound and determining chemical/phenotypic effect of compound on cell. Jiang Zhao H, ບໍ ij Pardo J, Chu P, Masuda E, WPI; 2003-340852/32 Liao XC,

Disclosure; Fig 2; 70pp; English.

The invention discloses method for identifying a compound that modulates lymphocyte activation/migration. The method comprises contacting an EDG G-protein coupled receptor (GPCR) family polypeptide, or its fragment or a

determining the chemical/phenotypic effect of the compound upon the call algorithms are subject, by administering to the subject a therapeutically effective anount of an identified compound, an EDG polypeptide or a methods for modulating to the subject a therapeutically effective amount of an identified compound, an EDG polypeptide or a nucleic acid encoding an EDG, or its fragment, and for screening for mucleic acid encoding an EDG, or its fragment, and for screening for modulating T or B cell receptors of the lymphocytes a CDMA library, stimulating T or B cell receptors of the lymphocytes of CDG ocls surface expression and rescuing CDMAs that modulate (I ymphocyte activation. The method is useful for identifying a compound such as an antibody, antisense molecule, small organic molecule, cartivation or a sphingolipid analogue) that modulates lymphocyte activation or migration. The compounds identified are useful for the transment (e.g. gene therapy) of diseases such as such as such as a structum diseases such as multiple sclerosis, scleroderma, pernicious and tissue transplant such as graft-versus-host disease, acute and chronic inflammation, an infection such as viral, fungal, protozoal or bacterial infections and diseases in which activation of immune response and stimulation of lymphocyte migration is desired. The sequence and stimulation of lymphocyte migration is desired. The sequence G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regencation-related disease; AIDS; cancer; immunological-related cell proliferative disease; autoimmune disease; Alzheimer's disease; atherosclerosis; infection; osteoarthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; pain; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea; 120 120 180 180 240 300 241 VFIVCWLPAFSILLIDYACPVHSCPILYKAHYFFAVSTLNSLINPVIYTWRSRDLRREVL 300 9 NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVQWFAREGSASITLSASV FSLLAIAIERHVAIAKVKLYGSDKSCRMLLLIGASWLISLVLGGLPILGWNCLGHLEACS 1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVOWFAREGSAFITLSASV TVLPLYAKHYVLCVVTIFSIILLAVVALYVRIYCVVRSSHADMAAPQTLALLKTVTIVLG VFIVCWLPAFSILLLDYACPVHSCPILYKAHYLFAVSTLNSLLNPVIYTWRSRDLRREVL 1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR Gaps comprising the polypeptide or its fragment with the compound, RPLOCWRPGVGGRRRGGTPGHHLLPLRSSSSLERGMHMPTSPTFLEGNTVV 353 ö Length 353; Indels Human sphingolipid receptor Edg5 protein SEQ ID NO:508.                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino addids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR. and in the production of specific antibody against a particular GPCR, and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related disease, immunological-related clisease, coll respective diseases, or autoimmune diseases, growth-related disease, contextive disease, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, fungal, protozoan or viral infections, concertificities, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, pain, psoriasis, concertion and acute anxiety, depresention, achizohrenia, denetia, mental retardation, memory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                            New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FSLLAIAIERHVAIAKVKLYGSDKSCRMLLLIGASWLISLVLGGLPIIGWNCLGHLEACS 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 NSKFHSAMYLFLGNLAASDLLAGVAFVANTLLSGSVTLRLTPVOWFAREGSAFITLSASV 120

collective quantitative analysis of the expression of a number of genes to identify those that are promoted or inhibited in a given cell or tissue. The genes are preferably gene families such as the G protein coupled receptor family, tyrosine oxidase receptor family, or ion channel gene family. The methods may be used in treatment of cancers, including prostate, ovarian, stomach, bladder, breast, and cancer of the intestines. EDG-1 and EDG-2 receptor agonists and antagonists may be used in the treatment and prevention of atherosclerosis, myocardial infarction, infarct or ischaemic disease of the brain. This sequence represents a protein of human EDG-5 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes a method for identifying an increase in risk for Type II diabetes mellitus and/or venous thrombosis/pulmonary embolism, comprising determining the presence of amino acid exchange at postition 286 from Val to Ala in the EDGS protein. Also described: (1) a method for screening pharmaceuticals useful for treating and/or preventing type II diabetes and/or venous thrombosis/pulmonary embolism, where a call or call extract is used that contains EDGS with the amino acid exchange, or the Variation in the mucleotide sequence of EDGS corting the dosage of the pharmaceutical described above by testing the human cell for the presence of EDGS with the amino acid exchange, or the Variation in the nucleotide sequence of EDGS protein or the EDGS-286-AA, (3) a method of selecting patients who will respond type II diabetes and/or venous thrombosis/pulmonary embolism by testing the probe of the respective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying an increase in risk for Type II diabetes mellitus and/or venous thrombosis/pulmonary embolism comprises determining in a probe the presence of amino acid exchange at position 286 from Val to Ala in the

          variation in the procession and the presence of EDGS protein or the EDGS-286-AA, and (4) a test kit for testing the presence of the amino acid exchange, or the variation in the nucleotide sequence of EDGS protein or the EDGS-286-AA. EDGS has antidiabetic and thrombolytic activities, and can be used in gene therapy. The methods are useful for identifying an increase in risk for type II diabetes mellitus and/or thrombosis/pulmonary embolism, and for screening pharmaceuticals useful for treating type II diabetes mellitus and/or venous thrombosis/pulmonary embolism. The methods are also useful for adapting the dosage of a pharmaceutical useful for treating the above diseases. The methods are useful for selecting patients who will respond to the pharmaceutical. The present sequence represents the human EDGS protein, which is used in an example

This invention relates to a novel method for identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism of a combination thereof. Specifically, it refers to a the endothealal differentiation gene 5 (EDG5) located on chromosome 19p13.2, which encodes a G protein coupled receptor protein. The present invention describes an immunochemically reactive labelled antibody based kit that can be used to identify the Val286Au variation in the EDG5 protein encoded by a single nucleotide polymorphism. Furthermore, this allele for preventative treatments of the aforementioned diseases, as well as for adapting desage for patients, for drug screening purposes or for patient selection in phase or clinical studies. This polypeptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying an increase in risk for type II diabetes mellitus, venous thrombosis, pulmonary embolism or its combination in subject by determining whether amino acid residue at position 286 of EDG5 protein is
                                             3 protein coupled receptor; EDGS; type II diabetes mellitus;
venous thrombosis; pulmonary embolism; endothelial differentiation gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MGSLYSEYLNPNKVQEHYNYTKETLETQETTSRQVASAFIVILCCAIVVENLLVLIAVAR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid encoding a mammalian Edg7 receptor. The mammalian Edg7 receptor proteins and nucleic acid encoding the proteins are useful for diagnosing and treating an abnormality associated with the activity of the mammalian Edg7 receptors, ciaberes, respiratory disorder, asthma, immune disorder, hypertension, diaberes, respiratory disorder, asthma, immune disorder, hypertension, disorder, memory disorder, obseity, pain, psychotic behaviour, affective disorder, migraine, cancer, AIDS, wound healing, or ischaemia-reperfusion injury-related diseases. The nucleic acids and proteins are also useful cor developing and designing drugs with higher specificity and fewer side effects. The nucleic acid such encoding mammalian Edg7 receptors and antisense oligonucleotides complementary to the nucleic acid sequences. The methods are also useful for identifying agonists and antagonists of Edg7 receptors. The present sequence represents the amino acid sequence of the human Edg5 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

compound (by contacting a preferred target region of a nucleic acid molecule encoding EDGS with one or more candidate antisense compounds comprising at least an 8-nucleobase portion that is complementary to the preferred target region and selecting for one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding EDGS). The compound, composition and methods are useful for treating a disease or condition associated with EDGS, such as a hyperproliferative disorder, developmental disorder or a disease or condition arising from aberrant modulating the expression of EDGS. Experimental protocols are described but no results are given. The present sequence is the human EDGS protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding endothelial differentiation gene 5 (EDGS, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and inhibits the expression of EDGS, i.e. is an antisense (AS) oligonuclectide. Also included are a composition comprising the compound and a carrier or diluent and a method for screening an antisense

compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.

Claim 151; SEQ ID NO 394; 542pp; English.

Human EDG5 receptor protein.

12-AUG-2004 (first entry)

ADO57997;

The invention relates to human and mouse G protein-coupled receptors (GPCRS) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids cof the invention; methods of screening for associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR-related diseases, a transgenic compounds useful in the treatment of GPCR-related diseases, a transgenic compounds useful in the treatment of GPCR-related diseases, a transgenic computation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transgenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polynucleotides of the invention. The comprising a GPCR nucleic acids and proteins may comprising a GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, disrented and vectors of the adrenal gland; disorders of the colon or intestine (e.g., crohn's disease, diarrhoea, food poisoning or irritable bowel compression, disbetic neuropathy, Parkinson's disease or schizophrenia); macemia or leukaemia); muscular disorders (e.g., autoimmune disorders or myocardial infarction); muscular disorders (e.g., autoimmune disorders (e.g., atthirtie, gout or osteoporosis); metabolic or nutritive disorders or atthirties, gout or osteoporosis); metabolic or nutritive disorders or himson's contact or overty or with the protein and sorders of the kidney, liver, lung, because the capted of the colon or intention with the colon or col uterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a GPCR of the invention. Note: The full sequence data for this patent did not form part of the printed specification; those sequences not shown were obtained in electronic format directly from WIPO at the print pub/published\_pct\_sequences.

disease. The compositions have the following activities: analgeeic, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antiacterial, antiarrhythmic, antiarteriosclerotic, antiasthmatic, antiacterial, antianter, activities antianter, carboraterive, dermatological, gynecological, neuroprotective, carboratorio, and virucide. The regulators of EDG5 are useful concropic, vasotropic, and virucide. The regulators of EDG5 are useful contropic, vasotropic, and virucide. The regulators of EDG5 are useful carboratorial diseases disorders of the peripheral and central nervous system, and respiratory diseases in a mammal. They are also useful for the regulation of EDG5 activity in a mammal having the disease.

Cardiovascular disease includes heart failure, myocardial infarction, cardiovascular disease includes heart failure, myocardial infarction, is chaemia, arrhythmias, and atherosclerosis. Examples of disorders of the gastricent erology system are dysphagia, Barrett's metaplasia, stress gastritis, gastric ulcers, and chronic pancreatitis. Examples of satrictis, and chronic pancreatitis. Examples of satrictis, dysmenorrhoea, and infartility. Disorders of the peripheral and central nervous system include Parkinson's disease, dementia, multiple sclerosis, etroke, and Alzheimer's disease. Respiratory diseases can be asthma or

The invention relates to a novel method for screening for therapeutic agents. The method comprises contacting a test compound with an endothelial differentiation sphingolipid G-protein-coupled receptor 5 compound, or determining EDGS polypeptide activity at a certain test compound concentration or in the absence of the test compound and at a different concentration of the test compound. The invention further comprises: diagnosing diseases such as a cardiovascular diseases, disorders of the gastroenterology system, reproductive diseases, disorders of the paripheral and central nervous system, and respiratory diseases in a mammal. The invention also comprises a pharmaceutical composition for the treatment of the diseases above comprising an EDGS polypeptide or which regulates the EDGS polypeptide

chronic obstructive pulmonary disease. The nucleotide sequences encoding EDGS are useful as hybridization probes, in constructing oligomers for PCR, for chromosome and gene mapping, in the recombinant production of EDGS, in generating antisense DNA or RNA and in molecular biology techniques that have not yet been developed. EDGS polypeptides are useful for immunising a mammal to produce polyclonal antibodies and for diagnostic purposes. This sequence represents the human EDGS receptor protein of the invention.
